

Tableau Sales Performance Assignment: BrewPoint Sales

Submitted by: Mayank Kukraja

This document outlines the required tasks for the completion of the BrewPoint Sales performance dashboard assignment.

Part A — Connect & Understand the Data

Data Connection: Connect Tableau Desktop to the `BrewPoint_Sales_Assignment_Dataset.xlsx` file.

Field Classification: List 3 fields classified as **Dimensions** and 3 fields classified as **Measures**.

Data Types: Identify one **discrete** field and one **continuous** field, providing a one-sentence explanation for each.

Connection Type: State whether you used a **Live** or **Extract** connection and justify why it was the appropriate choice for this exercise.

Proof of Work / Screenshots

Field Classification:

Dimensions

- Market
- State
- Product Category

Measures

- Sales
- Profit
- Quantity

Data Types:

Discrete: Market

→ because it contains separate categories like East, West, Central, South.

Continuous: Sales

→ because Sales is a numerical value that can vary across a range.

I used an Extract because the dataset is relatively small and static, and an extract provides efficient performance for analysis and filtering.

Part B — Foundational Charts

Bar Chart: Create a bar chart showing **Sales by Product Category**.

Line Chart: Create a line chart showing the **Sales trend by month** using the **Order Date** field.

Sorting: Apply a **descending sort** to either the bar chart or the line chart.

Filtering: Apply at least one basic filter (e.g., filtering for a specific **Market**).

Formatting: Format the **Sales axis** to display values as currency.

Proof of Work / Screenshots

Bar Chart: Create a bar chart showing **Sales by Product Category**.

Here i created the **bar chart** and also performed:

Sorting in Descending order

Filtering option that is of market , you can see it on the right corner of the screen

Formatting from basic numbers to indian currency

-Line Chart: Create a line chart showing the **Sales trend by month** using the **Order Date** field.

Also applied **market filter** on this chart as well just to understand how it works in different charts

Part C — Intermediate Charts

Scatter Plot: Build a scatter plot of **Sales vs. Profit**, colored by **Product Category**, and identify any visible outliers.

Dual-Axis Chart: Build a dual-axis chart that combines **Sales and Profit** for each **Market**.

Highlight Table: Create one highlight table (e.g., **Profit by Market and Product Category**).

Proof of Work / Screenshots

Scatter Plot: Build a scatter plot of **Sales vs. Profit**, colored by **Product Category**, and identify any visible outliers.

AS in this ss we can clearly see that there are some of the outliers present that have

- very high sales but low profit
- some have very high profits
- some have negative profit

Dual-Axis Chart: Build a dual-axis chart that combines **Sales and Profit** for each **Market**.

To differentiate the sales and profit we implemented it as:

Sales → **Bar**

Profit → **Line**

Highlight Table: Create one highlight table (e.g., **Profit by Market and Product Category**).

Part D — Calculated Fields

Profit Ratio: Create a calculated field named **Profit Ratio** defined as $[Profit] / [Sales]$.

○

Proof of Work / Screenshots

Profit Ratio: Create a calculated field named **Profit Ratio** defined as $[Profit] / [Sales]$.

Profit Ratio

Sales Data (BrewPoint_Sales_Assignment_Dataset)

×

SUM([Profit])/SUM([Sales])

▶

The calculation is valid.

2 Dependencies ▾

Apply

OK

margin label

Sales Data (BrewPoint_Sales_Assignment_Dataset)

×

|IF [Profit Ratio] >= 0.15 THEN
 "High Margin"
ELSE
 "Low Margin"
END

▶

The calculation is valid.

1 Dependency ▾

Apply

OK

IF Logic: Created a second calculated field using **IF logic** to label order lines as "High Margin" or "Low Margin" based on a specific **Profit Ratio** threshold.

- **Selected Threshold: 15%**
- At first i put the **threshold as 20 %** than i just changed the threshold that how the things will changed
- **Why 15%-**
- It's a simple, reasonable threshold for separating relatively stronger-margin orders from lower-margin orders in this exercise.

As both the created calculated fields are working correctly or not we check it in a new worksheet that is **margin check**

Part E — Filters

Quick Filter: Add a **quick filter** to the dashboard that allows a viewer to select a specific **Market**.

Context Filter: Add a **context filter** on a field of your choice and explain in one sentence why this field was chosen for context rather than a standard filter.

Proof of Work / Screenshots

As for the **Quick filter** we already applied a filter in the sales by category and on monthly sales trend chart on which we applied the **market** filter on that

Context filter: A context filter is a filter that Tableau applies before other filters. As u can see that the Market filter is in grey color in the filter section that means it is a context filter

explain in one sentence why this field was chosen for context rather than a standard filter.

-> I chose Market as the context filter because it limits the analysis to a selected sales region before other filtering and calculations are applied.

Part F — Capstone Dashboard

Assembly: Combine at least **three worksheets** created in the previous parts into a single dashboard.

Interactivity: Add a **filter action** so that selecting a data point in one chart automatically filters the other charts on the dashboard.

Design: Add a clear **dashboard title** and ensure that all colors, fonts, and formatting are consistent and professional.

Proof of Work / Screenshots

We used three worksheet here to create this dashboard , the sheets that we used are:

Sales by Category

Monthly sales trend

Sales vs profit

The filter section is also visible at the bottom right corner of the dashboard

Interactivity: Add a **filter action** so that selecting a data point in one chart automatically filters the other charts on the dashboard.

Dashboard when we select only the Espresso category and the below was of tea category we can also see that the color of product in the sales vs profit chart is also changes when we select different products.

Design: Add a clear **dashboard title** and ensure that all colors, fonts, and formatting are consistent and professional.

- I tried to make the whole dashboard to look it clean and consistent in terms of currency as rupee , color of all the texts
- I also changed the **titles fonts** and width as well making some text bold and keep some as it is
- The filter option is also moved to the bottom right for clear dashboard and for better spacing
- Changed the name of **dashboard 1** to **BrewPoint Sales performance dashboard**

I tried to document all the process that i have performed to complete this assignment and also tried to answer all the questions that are asked in the assignment.

The .twbx file be attached with the document in the link
